

Figure 1 GMAIS architecture: a two-tier multi-agent topology under asynchronous governance mediation

$M = (A, S, E, G, P)$ (Section 3.3.1). Each event $e = (m, t, c)$ is a payload m at timestamp t with token context c . Green paths are governance-mediated: every inter-agent event is policy-evaluated, need-to-know filtered and appended to the hash-chained audit log.
