

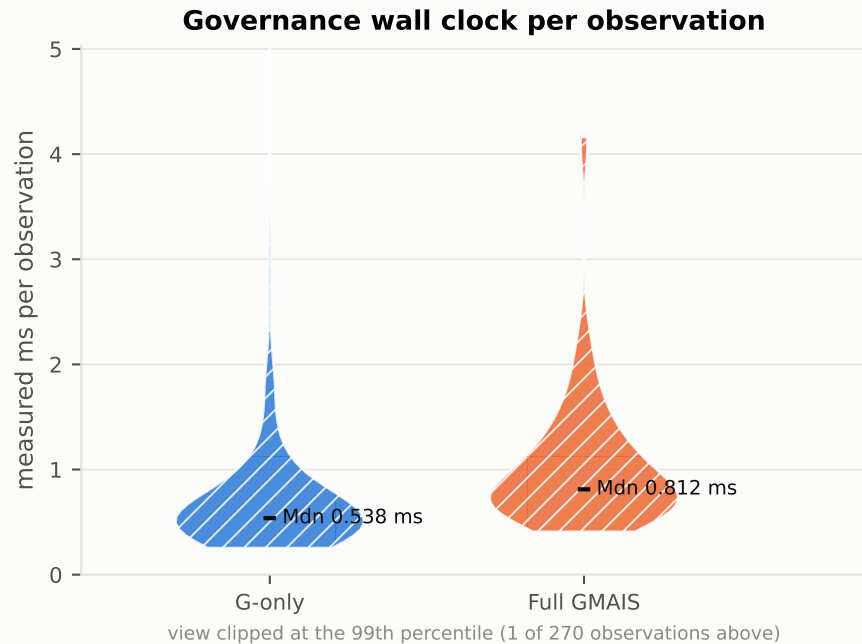

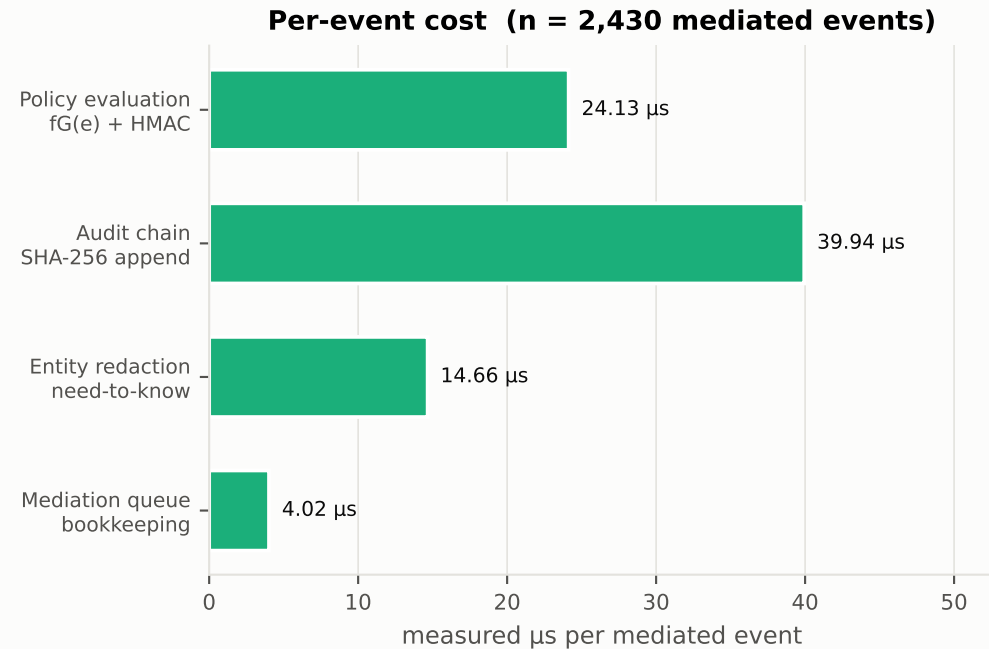

Figure 8 Measured governance overhead, attributed by component

Single campaign, warm-up observations discarded. Measured with `time.perf_counter_ns`; clock resolution 40 ns on Linux-6.8.0-139-generic-x86_64-with-glibc2.39.

Component attribution is not stable between runs — see ``gmais.cli timing --repeats N`` and Limitation L9. The end-to-end total is stable to $\sim 1.45\times$; the per-component split is not.
